The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD86) and/or B7.2 antigen (CD86) for inducing the apoptosis of B7+ cells. The invention is useful for inducing the apoptosis of B7+ cells. The invention is useful for inducing the apoptosis of B7+ cells. The invention is a cancer where B cells promote the growth and/or metastasis of tumours, B cell lymphoma, B cell leukaemia, and autoimmune diseases such as idiopathic thrombocytopania purpura, systemic lupus, erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-vs-hoot disease. The antibody is useful for immunosuppression or graft-vs-hoot disease. The antibody is useful for immunosuppression or graft-vs-hoot disease. The antibody is useful for immunosuppression crimen or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive and hyperproliferative collicis, food-related allergies e.g. migraine, thinitis and eczema, and other types of allergies. The present nucleic caid sequence encodes the light chain of 7010, a primatised antibody used in the invention to induce apoptosis and inhibit production of interleukin-2 (IL-2).
                                                                                                                                                                                                                                                                                                                                                                        Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

This antibody contains the antigen binding domains (see also AAW14922-23) of a cynomolgus monkey anti-CD4 monoclonal antibody, a human heavy chain constant region of gamma 1 isotype and GM1a, GM1z allotype, and a human lambda light constant region of the Oz minus, mcg minus genotype and Re minus allotype. The immunoglobulin genes were cloned into mammalian expression vector

TCAE 6, and chimeric antibody was produced in CHO cells. CE9.1 binds to domain 1 of human, but not macaque, CD4, a region involved in the interaction with MHC class II molecules on antigenpresenting cells. It shows potent immunomodulatory activity with low immunogenicity in humans, and can be used to treat autoimmune diseases such as rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Expressed sequence tag; human; bladder; tumour; cancer; cytostatic;

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating

(II) are used to recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for treatment of bladder cancer, to directly treat this form of cancer (including expression from gene directly treat this form of cancer (including expression from gene is also used for the generation of specific antibodies. (II) are identified by assembling ESTS (expressed sequence teags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a particular tissue. AAZ43260-243309 represent expressed sequence tag (EST) fragments isolated from a human bladder tumour cDNA library which encode the proteins represented in AAY66143-Y66198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ï

                 The polypeptide and polynuclebride sequences have applications in diagnostics, forenaics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Monoclonal antibody; Mab; macaque; light chain; primate; antigen; CD80;
  disorders involving aberrant protein expression or biological activity.

This sequence encodes a primatized form of the antibody 16C10 light chain from macaque. This sequence is used in a method which studies new macaque. This sequence is used in a method which studies new monoclonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to monoclonal antibodies binding of these antigens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autofimmune diseases, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, nost diseases, B cell lymphoma, inflections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAD can be confugated to a drug or toxin. MAD's or their fragments, can also be used as imaging agents and as vaccines or immunosupersessutes allockines mill molecule immunosuppressants. Blockines B/Ockines interactions or induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunosuppresses.

The present invention relates to a new use of a monoclonal antibody which specifically binds to B7.1 antigen (CD80) and/or B7.2 antigen (CD86) for inducing the apoptosis of .B7 the invention is concer inducing the apoptosis of .B7 the invention is a cancer where B calls promote the growth and/or metastasis of tumours, B call lymphoma, B call lawrends, and autoimmune diseases such as a concer where B calls promote the growth and/or metastasis of tumours, B call lymphoma, B call lawrends, and autoimmune diseases Buch as diopathic thrombocytopenia purpura, systemic lupus, erythematcosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bile disease, allergy, multiple sclerosis or graft-ve-host disease. The antibody is useful for immunosuppression in a human or animal and for treating or preventing resistance to or rejection of transplanted organ or tissue for treating proliferative and hyperproliferative diseases, for treating reversible obstructive disease, intestinal inflammations and allergies e.g. Crohn's disease and ulcerative collitis, food-related allergies e.g. Crohn's caimays disease, and other types of allergies. The present nucleic acid sequence encodes the light chain of 16c10, a primatised antibody used in the invention to induce apoptosis and inhibit production of
                                                                                                            Use of monoclonal antibody which specifically binds to B7.1 antigen CD80 and/or B7.2 antigen CD86 for inducing apoptosis of B7+ cells, treating cancer, graft-vs-host disease and autoimmune disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GCCTATGAACTGACTCAGCCACCCTCGGTGTCAGTGTCCCCCAGGACAGACGGCCAGGATC 120

Cloned 16C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7C10 and 7B6 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

                                                                                                                                                                                                                                                                                                                            The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP4328) and to cDNAs encoding them (ABP4131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigens to polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumnours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polyardome, ovarian oranges, and dysmenorinosa), endocrine disorders, infections (e.g., chiammydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, ophoritis and vaginitis), immune disorders (e.g., congenital and acquired insorders, nucleotides (e.g., anaemia), cardiovascular disorders, oblood-related disorders (e.g., anaemia), cardiovascular disorders, nucleotides may also be used in screening for compounds which indulate ovarian antigen expression or activity. The polymcleotides may further be used for gene therapy, chromosome mapping, in the modulate ovarian antigen expression or activity. The polymcleotides may be used as food additives or to prepare antibodies useful in disease diagnosis, drum an ovarian antigen of the invention of individuals and in forensic analysis, and the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CCTGTGGGGGGGGAGACAGTAGAATGAATATGTCCACTGGTACCAGCAGAAGCCAGGGC 181

The invention relates to isolated polynucleotide (1) and polypeptide (II) sequences. (I) is useful a hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or

                                                                                                                                                                                                                                          ä
quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensiss, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pct_sequences.

The invention relates to forty four human secreted proteins (referred to as SECP-1 to SECP-44) and the nucleic acids encoding them. Also included are a host cell transformed with the nucleic acid, a cranspenic animal comprising the nucleic acid, an anti-SECP actions of the SECP proteins in isolating agonists and antagonists of SECP activity and a method of isolating compounds which alter the expression of the SECP nucleic acid. The SECP polynucleotides and polypeptides are useful in the diagnosis, treatment and prevention of cardiovascular (e.g. atherosclerosis, hypertension, myocardial in the diagnosis, treatment and prevention of cardiovascular (e.g. atherosclerosis, hypertension, myocardial in the diagnosis, treatment and prevention of cardiovascular (e.g. atherosclerosis, bypertension, myocardial in the cardiovascular (e.g. buchenne and Becker muscular (e.g. cancer), developmental (e.g. buchenne and Becker muscular disprachy, and neurological (e.g. epilepsy, Alzheimer's disease) disorders. Numerous other examples of each disorder are given in the specification. The present sequence is a CDNA encoding a SECP protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Forty four human secreted proteins (referred to as SECP-1 to SECP-44), useful in the diagnosis, treatment and prevention of cardiovascular (e.g. atherosclerosis), autorimmune/inflammatory (e.g. allergies) and cell proliferative disorders
                                         immunosuppressive; antiviral; anti-HIV; antiarthritic; antirheumatic; muscular active general; anticonvulsant; noctropic; neuroprofecctive; antialergic; hypotensive; cardiovascular disorder; atherosclerosis; hypotensive; cardiovascular disorder; atherosclerosis; inflammatory disorder; AIDS; acquired immunodeficiency syndrome; allergy; rheumatoid arthritis; cell proliferative disorder; cancer; developmental disorder; buchenne muscular dystroph; neurological disorder; epilepsy; Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 54 ATGGCCTGGACCCCTCTCCTGCTCCCCCTCCTCACTTTCTGCACAGTCTCTGAGGCCTCC 113

The invention relates to polynuclectides encoding novel human proteins or their active domains. The polypeptides in a method of artibodies raised against the polypeptides are used in a method of reatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as conclusive weight markers, food supplements, and in antibody production. The polypeptides are used to identify compounds which bind to the polypeptides. Polynucleotides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or RNA and in gene therapy. Polypeptides of the invention can be used to raise antibodies/elicit an immune response, to determine biological activity, to raise antibodies/elicit an immune response, to determine quantitative protein levels, as tissue markers, and to isolate receptors or ligands. Content and/or nerve tissue, wound healing, treating blacelet disorders, stem cell disorders, regenerating bone, carrilage, tendon, ligament and/or nerve tissue, wound healing, treating burns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis anemain, and elecates, at the cell disorders, regenerating one contraceptive, treating osteoporosis and osteoarthritis, anemain, inferior may also be used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä

polypeptide (II) sequences (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as inaging of sites expressing (II). (I) and (II) are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences Assayled represent novel human or amino acid sequences. Assayled represent movel human Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from Wipo at fip. wipo.int/pub/published_pot_sequences.

```
The invention relates to polymuclectides encoding novel human proteins or their active domains. The polypeptides in a method of antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as montal polypeptides are used to identify compounds which bind to the polypeptides. Polymucleotides of the invention are used as probes and principles, Polypeptides of the invention are used as probes and production of recombinant proteins, and in generating anti-sense DNA or trarget drugs to a tumour, in assays to determine biological activity, to target drugs to a tumour, in assays to determine biological activity, to raise antibodies/elicit an immune response, to determine duantitative protein levels, as tissue markers, and to isolate receptors or ligands. Polypeptides of the invention may also be useful in treating platelet disorders, stem cell disorders, regenerating bone, cartilage, tendon, alsorders, stem cell disorders, wound healing, treating purns, promoting the proliferation, differentiation and survival of stem cells, as a contraceptive, treating osteoporosis and osteoarthritis, anaemia contraceptive, treating osteoporosis and osteoarthritis, anaemia sclerosis, stroke, immune deficiencies resulting from bacterial, viral or fungal infection or from autoimmunity, cancer, allergy, asthma, and infection.
                                                                                                                                                                                                                                                                                          Isolated polypeptides useful for treating anti-inflammatory diseases, nervous system disorders, and for regenerating bone and cartilage
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 1825 BP; 361 A; 509 C; 560 G; 395 T; 0 other;

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
